[Age-dependent differences in the mechanism of regeneration of functional activity in the olfactory centers of rats]. Substitutive neurogenesis is a characteristic of a number of structures in the central nervous system of vertebrates. Both adult and newborn neurons functionally integrate into existing neural networks, playing an important role in learning and memory. In the present paper, we studied the possibility of formation of the compensatory or therapeutic brain plasticity in different age groups. Functional activity of the olfactory system was studied in male rats of different ages, aged 1 to 12 months. Injection of the rabdomiotropic virus (RV1-2) into the olfactory bulb (OB) induced formation of the glial scars and reactive changes in the neuropil, including a number of aggregates and glial cell-like structures, which were found in this area in all age groups. There were also differences in the
